

Circular motion

Formulae

$$\text{Angular speed, } \omega = \frac{\theta}{t} = 2\pi f \text{ unit: rad s}^{-1}$$

$$\text{Linear velocity, } v = \frac{2\pi r}{T} = 2\pi fr = r\omega$$

$$\text{Magnitude of centripetal acceleration is given by } a = \frac{v^2}{r}$$

$$\text{Using } F = ma, F = \frac{mv^2}{r} = mr\omega^2$$

Humpback bridge and "looping the loop"

To keep a string taut, the magnitude of the centripetal force must be greater than or equal to the weight.

$$mv^2 \geq mg \text{ or alternatively } mr\omega^2 \geq mg$$

$$\text{Tension in the string at the top} = \frac{mv^2}{r} - mg$$

$$\text{Tension in the string at the bottom} = \frac{mv^2}{r} + mg$$

Keeping a car on a humpback bridge requires weight to equal the centripetal force (i.e.

$$mg \geq \frac{mv^2}{r})$$

$$\text{Support force from the road} = mg - \frac{mv^2}{r}$$

Motion around a banked track

Motion around a banked track

The vertical component is weight: $mg = R \cos \theta$

The horizontal component is centripetal force: $F = \frac{mv^2}{r} = R \sin \theta$

For there to be no sideways friction: $v = \sqrt{gr \tan \theta}$
