# Kinetic Theory and Ideal Gases

Q1.

A fine-beam tube is used for investigating properties of electrons.

An electron beam is produced inside a spherical glass bulb. The bulb contains neon gas at a very low pressure.

The neon gas is at a pressure of 1.25 Pa and a temperature of 25 °C.

Calculate the number *N* of neon atoms inside the bulb.

ould diameter = 16.0 cm

Q2.

The photographs show a wooden pop gun before and after the cork is popped.

The diagram shows a cross-section through the pop gun.

Initially the piston is at the right-hand end of the cylinder, as shown. Then the cork is pushed into the other end of the cylinder.

When the handle is pushed in, the pressure of the air in the cylinder increases. This exerts an additional force on the cork.

Once the additional force is sufficient to overcome the frictional force between the cork and the cylinder, the cork is pushed out.

Calculate the root mean square speed of the molecules of air in the cylinder before the handle is pushed in.

average mass of molecule of air = $4.8 \times 10^{-26}$ kg temperature of air = $19  ^{\circ}$ C	
	(2)
Root mean square speed =

#### Q3.

The photographs show a wooden pop gun before and after the cork is popped.

The diagram shows a cross-section through the pop gun.

Initially the piston is at the right-hand end of the cylinder, as shown. Then the cork is pushed into the other end of the cylinder.

When the handle is pushed in, the pressure of the air in the cylinder increases. This exerts an additional force on the cork.

Once the additional force is sufficient to overcome the frictional force between the cork and the cylinder, the cork is pushed out.

Calculate the temperature of the gas in the cylinder at the instant the cork is expelled.

volume of air in the cylinder with the handle pulled out =  $1.1 \times 10^{-5}$  m<sup>3</sup> volume of air in the cylinder at the moment the cork is pushed out =  $6.7 \times 10^{-6}$  m<sup>3</sup> atmospheric pressure =  $1.0 \times 10^{5}$  Pa initial temperature of air = 19 °C

#### Q4.

When a large potential difference is applied to a discharge tube, the gas in the discharge tube emits coloured light. When this light is passed through a diffraction grating, an emission spectrum which is made up of a series of lines of different wavelengths may be seen.

The photographs show the spectra produced from a tube containing hydrogen and a tube containing helium.

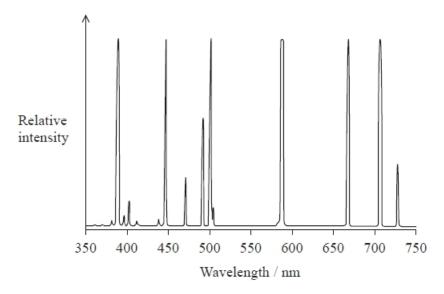

Hydrogen:

Helium:

The graph shows the relative intensities of different wavelengths of light in the spectrum of a sample of helium.

The graph shows that the lines are not at a single wavelength. This effect is known as thermal Doppler broadening and occurs because of the random motion of the helium atoms.

(i) Explain why the thermal motion of the helium atoms causes the broadening of the

spectral lines.	
	(2)

(ii) The width of a line may be used to determine the speed of the atoms in the gas and hence the temperature of the gas.	
The spectral line with wavelength 587 nm for a particular tube containing helium has a width of $6 \times 10^{-3}$ nm.	
(1) Show that this corresponds to a speed, for a helium atom, of about 1500 m s <sup>-1</sup> .	(2)
(2) Assuming that this is the root mean square speed for the helium (He 4) atoms in the tube, calculate the temperature of the gas in the tube.	
	(3)
Temperature =

Q5.	
The formulae sheet for this paper includes the equation $pV = \frac{1}{3}Nm\langle c^2\rangle$	
Derive the equation $\frac{1}{2}m\langle c^2\rangle = \frac{3}{2}kT$	
Derive the equation $\frac{1}{2}m\langle c^2\rangle = \frac{1}{2}\kappa I$	(2)

(Total for question = 2 marks)

Our understanding of the atom has developed over time, from early models in which atoms were considered to be hard incompressible spheres, through to the nuclear model of the atom and the ladder model in which electrons exist in a discrete number of allowed energy states.

\* The model of atoms as hard incompressible spheres, moving rapidly and randomly, can be used to explain why gases exert a pressure.

Explain, using ideas of momentum, why the pressure exerted by a gas increases as the

temperature of the gas increases.

Q9.
Air is trapped in a glass tube. When the air is forced into a smaller volume at a constant temperature, the pressure increases.
Which of the following statements about air molecules is a reason why the pressure the trapped air exerts on the tube increases?
The molecules have a greater mean kinetic energy.
☐ B The molecules make more frequent collisions with each other.
☐ C The molecules make more frequent collisions with the walls of the tube.
■ D The molecules experience a greater change in momentum when they collide with the tube.

A sample of an ideal gas has pressure p, volume V and absolute temperature T.

The volume of the gas is decreased to  $\frac{2}{3}V$  and the temperature increased to  $\frac{6}{5}I$ 

Which of the following is the new pressure of the gas?

- $\square$  A  $\frac{5}{9}^p$
- $\square$  B  $\frac{4}{5}$
- $\square$  C  $\frac{5}{4}$
- $\square$  D  $\frac{9}{5}$

(Total for question = 1 mark)

Pressure = .....

#### Q11.

At the Culham Centre for Fusion Energy (CCFE) experiments are carried out to investigate nuclear fusion and the properties of plasmas. A plasma consists of ionised gas, containing positive ions and electrons.

In a plasma experiment 5.0 mg of deuterium, an isotope of hydrogen, occupies a volume of  $98 \, \text{m}^3$ . The temperature of deuterium is raised to  $1.3 \times 10^8 \, \text{K}$ . In this experiment, the deuterium behaves as an ideal gas.

<ul><li>(i) Calculate the pressure due to the deuterium ion:</li></ul>	(i)	Calculate t	ne pressure	due to	the deute	rium ions
--	-----	-------------	-------------	--------	-----------	-----------

mass of deuterium ion = 3.3 × 10<sup>-27</sup> kg

(3)

(ii) Calculate the root mean square speed of the deuterium ions at this temperature.
(2)
Root mean square speed =
(iii) The temperature of the plasma is monitored using the Doppler effect. Light from a laser is directed into the plasma and the wavelength of the light reflected is measured.
The Doppler shift observed when light is reflected by a deuterium ion is twice the Doppler shift that would be observed for a source of light moving at the same speed as the deuterium ion.
Calculate the maximum wavelength of light that would be detected after reflection from a deuterium ion moving at $1.5 \times 106  \text{m s}^{-1}$ .
wavelength of laser light = 1064 nm
(3)
Maximum wavelength detected =
Maximum wavelength detected =

Calculate the root-mean-square speed of gas molecules in the gas at 25 °C.
The molecules in a sample of gas have a mass of 5.0 * 10 - kg.

#### Q14.

An electric drinks cooler is an appliance consisting of a thermally insulated compartment and a heat pump that transfers heat from the inside of the cooler to the room in which the cooler is placed.

This maintains the temperature of the inside of the cooler below the temperature of the room.

(Source: http://www.americanas.com.br/produto/110863245/adega-de-vinhos-easycooler-12 garrafas)

On closing the door of the cooler, warm air at atmospheric pressure and at a temperature of 22.5°C is trapped inside. After a time, the internal temperature stabilises at 3.3°C.

A student notices that the door is difficult to open and concludes that this is because the air inside has cooled down and reduced the pressure.

Carry out a calculation to assess the validity of the student's conclusion.

atmospheric pressure = 102 kPa

area of door = 0.15 m<sup>2</sup>

	An explanation that makes reference to:      the temperature is constant when the puree boils because the average kinetic energy of the molecules in the puree is constant. (1)      when boiling occurs, the thermal energy supplied increases the potential energy of the molecules causing the molecules to move further apart (producing steam) (1) OR when boiling occurs, the thermal energy supplied increases the potential energy of the molecules breaking molecular bonds. (1)		
			2

### Q8.

Question Number	Acceptable Answer		Additional Guidance	Mark
(i)	• Use of $\frac{1}{2}m\langle c^2 \rangle = \frac{3}{2}kT$ • mean kinetic energy = $6.4 \times 10^{-20}$ J	(1) (1)	Example of calculation: $ \frac{1}{2}m\langle c^2 \rangle = \frac{3}{2}kT $ $ = \frac{3}{2} \times 1.38 \times 10^{-23} \text{J K}^{-1} \times 3100 \text{ K} = 6.42 \times 10^{-20} \text{J} $	2

Question Number	Acceptable Answer		Additional Guidance	Mark
(ii)	There are electron transitions between energy levels in the atoms, When electrons return to a lower level they emit energy in the form of photons	(1) (1)		2

# Q9.

Question Number	Answers	Mark
	The only correct answer is C A is incorrect because the mean kinetic energy is constant at constant temperature B is incorrect because collisions between molecules do not increase the force on the walls of the container D is incorrect because the momentum change depends upon the root mean square speed of the molecules	1

### Q10.

Question Number	Acceptable answers	Additional guidance	Mark
	The only correct answer is D because pressure is proportional to		1
	absolute temperature and inversely proportional to volume, so the		
	effect of the volume change is to increase the pressure by 3/2 and		
	the effect of the temperature change is to increase the pressure by		
	6/5, and 18/10 = 9/5		
	A is not correct because a pressure of 5/9 p would depend on		
	pressure being proportional to volume and inversely proportional to		
	absolute temperature rather than being proportional to absolute		
	temperature and inversely proportional to volume		
	B is not correct because this assumes that pressure is proportional to		
	both volume and absolute temperature, giving an answer of $4/5 p$ ,		
	instead of assuming that pressure is proportional to absolute		
	temperature and inversely proportional to volume		
	C is not correct because this assumes that pressure is inversely		
	proportional to both volume and absolute temperature, giving an		
	answer of $5/4 p$ , instead of assuming that pressure is proportional to		
	absolute temperature and inversely proportional to volume
